

Machine Learning Engineer: Coding Assessment

Context

You are provided with two real-world RFP (Request for Proposal) documents related to data center and infrastructure services. These RFPs represent different environments:

- One with stronger security and compliance requirements
- One with stronger networking and cloud connectivity requirements

You are also provided with a brief overview of infrastructure solution categories (sales plays), such as:

- Hybrid Cloud • Interconnection • Secure Hosting • Edge/Low-latency

Objective

Build a lightweight system that can:

1. Extract key information from the RFPs
2. Organize the extracted data into a structured format
3. Map the requirements to relevant infrastructure solution categories

Your solution should demonstrate how you would approach this problem in a scalable, production-oriented setting, even if your implementation is simplified.

Expected Outputs

1. Structured Extraction

Provide machine-readable structured output (JSON or similar) including:

- Administrative details • Technical requirements • Operational constraints

2. Solution Mapping

Map extracted requirements to relevant solution categories (sales plays), including:

- Category name • Supporting evidence • Confidence (optional)

Note: The two RFPs represent different problem types. Your mapping should reflect these differences.

3. System Design Note (1–2 pages)

Describe:

- How your solution works
- Key design decisions and trade-offs
- How you would scale this system to handle many RFPs
- How you would break the system into components or stages

Implementation Guidelines

- You may use any tools or frameworks (Python, APIs, LLMs, etc.)
- Focus on clarity, structure, and reasoning over completeness
- Reasonable assumptions may be made where information is incomplete; document major assumptions clearly
- Keep the solution lightweight but extensible

Submission

Please provide:

- Code + outputs + short design note (single zip/tar file)
- Short README with instructions to run the solution

Time Expectation

~3–6 hours
